

# Activate Spatial Workshop from within your other IT-systems

## Make Spatial Workshop work with the data within your corporate IT-systems

When your customers phones, you may want to see their location immediately. When you work with data in your ERP system you may want to see the environment where your assets are located. Or while working with Spatial Workshop, the system may display a list of objects that have been updated within one of your other applications.

The Spatial Workshop activator API allows you to add functionality to your existing It-systems to activate specific functions within Spatial Workshop.

## Spatial Workshop Activator API

The Spatial Workshop Activator API is a .Net toolkit that can be used to drive some of the Spatial Workshop functionality from an external application. This allows external applications to drive functions like:

- Going to a Coordinate
- Going to an Envelope
- Going to a specific Object
- Going to a Smart Link
- Going to a Place (using the place finder)
- Browsing a Collection

When using one of the indicated functions, Spatial Workshop will be fired up (if not already running) and the indicated function will be carried out.

## Integration through activation

The Spatial Workshop Activator API allows you to activate Spatial Workshop functionality within the context of your other It-systems.
